

M&G Global Listed Infrastructure Fund - Sterling Class I

Fund Factsheet as at 31 July 2018

Fund description

The fund aims to deliver a combination of capital growth and income that is higher, net of the ongoing charge figure, than that of the MSCI All Country World Index over any five-year period and to increase the income stream every year, in sterling terms. It looks to do this by investing at least 80% of the fund in shares issued by infrastructure companies, investment trusts and real estate investment trusts of any size, from any country, including emerging markets. The fund usually holds shares in fewer than 50 companies. Infrastructure companies include businesses in the following sectors: utilities, energy, transport, health, education, security, communications, and transactions. Sustainability considerations encompassing Environmental, Social and Governance (ESG) issues are integrated into the investment process.

Risks associated with this fund

For any past performance shown, please note that past performance is not a guide to future performance.

The value of investments and the income from them will rise and fall. This will cause the fund price, as well as any income paid by the fund, to fall as well as rise. There is no guarantee the fund will achieve its objective, and you may not get back the amount you originally invested.

Changes in currency exchange rates will affect the value of your investment.

The fund holds a relatively small number of investments and, as a result, may experience larger price rises and falls than a fund which holds a larger number of investments.

The fund will invest in emerging markets which are generally more sensitive to economic and political factors, and where investments are less easily bought and sold. In exceptional circumstances, the fund may encounter difficulties when selling or collecting income from these investments, which could cause the fund to incur a loss. In extreme circumstances, it could lead to the temporary suspension of dealing in shares in the fund.

Further risk factors that apply to the fund can be found in the fund's Key Investor Information Document (KIID).

Things you should know

The fund invests mainly in company shares and is therefore likely to experience larger price fluctuations than funds that invest in bonds and/or cash.

Key information

Fund manager	Alex Araujo
Fund manager tenure from	5 October 2017
Deputy fund manager	John Weavers
Launch date	5 October 2017
Launch of share class	5 October 2017
Fund size (millions)	£13.08
Fund type	OEIC, incorporated in the UK
Comparative index	MSCI ACWI Index
Comparative sector	IA Global sector
Number of companies	43
Share type	Acc & Inc
Payment dates	Feb, May, Aug, Nov
Ex-dividend dates	Jan, Apr, Jul, Oct

Please see the glossary for an explanation of terms used.

This glossary provides an explanation of terms used in this factsheet and in our literature.

Asset: Anything having commercial or exchange value that is owned by a business, institution or individual.

Asset class: Category of assets, such as cash, company shares, fixed income securities and their sub-categories, as well as tangible assets such as real estate.

Bond: A loan in the form of a security, usually issued by a government or company, which normally pays a fixed rate of interest over a given time period, at the end of which the initial amount borrowed is repaid.

Capital: Refers to the financial assets, or resources, that a company has to fund its business operations.

Capitalisation: The total market value of all of a company's outstanding shares.

Comparative sector: A group of funds with similar investment objectives and/or types of investment, as classified by bodies such as the Investment Association (IA) or Morningstar™. Sector definitions are mostly based on the main assets a fund should invest in, and may also have a geographic focus. Sectors can be the basis for comparing the different characteristics of similar funds, such as their performance or charging structure.

Consumer Prices Index (CPI): An index used to measure inflation, which is the rate of change in prices for a basket of goods and services. The contents of the basket are meant to be representative of products and services we typically spend our money on.

Convertible bonds: Fixed income securities that can be exchanged for predetermined amounts of company shares at certain times during their life.

Corporate bonds: Fixed income securities issued by a company. They are also known as bonds and can offer higher interest payments than bonds issued by governments as they are often considered more risky.

Credit: The borrowing capacity of an individual, company or government. More narrowly, the term is often used as a synonym for fixed income securities issued by companies.

Credit Default Swaps (CDS): Are a type of derivative, namely financial instruments whose value, and price, are dependent on one or more underlying assets. CDS are insurance-like contracts that allow investors to transfer the risk of a fixed income security defaulting to another investor.

Credit rating: An independent assessment of a borrower's ability to repay its debts. A high rating indicates that the credit rating agency considers the issuer to be at low risk of default; likewise, a low rating indicates high risk of default. Standard & Poor's, Fitch and Moody's are the three most prominent credit rating agencies. Default means that a company or government is unable to meet interest payments or repay the initial investment amount at the end of security's life.

Credit spread: The difference between the yield of a corporate bond, a fixed income security issued by a company, and a government bond of the same life span. Yield refers to the income received from an investment and is expressed as a percentage of the investment's current market value, and a bond is a fixed income security.

Default: When a borrower does not maintain interest payments or repay the amount borrowed when due.

Derivatives: Financial instruments whose value, and price, are dependent on one or more underlying assets. Derivatives can be used to gain exposure to, or to help protect against, expected changes in the value of the underlying investments. Derivatives may be traded on a regulated exchange or traded over the counter.

Developed economy / market: Well-established economies with a high degree of industrialisation, standard of living and security.

Dividend: Dividends represent a share in the profits of the company and are paid out to a company's shareholders at set times of the year.

Duration: A measure of the sensitivity of a fixed income security, also called a bond, or bond fund to changes in interest rates. The longer a bond or bond fund's duration, the more sensitive it is to interest rate movements.

Emerging economy or market: Economies in the process of rapid growth and increasing industrialisation. Investments in emerging markets are generally considered to be riskier than those in developed markets.

Episode: A phase during which investors allow their emotions to affect their decision making, which can cause financial markets to move irrationally.

Equities: Shares of ownership in a company.

Ex-dividend, ex-distribution or XD date: The date on which declared distributions officially belong to underlying investors.

Exposure: The proportion of a fund invested in a particular share/fixed income security, sector/region, usually expressed as a percentage of the overall portfolio.

Fixed income security: A loan in the form of a security, usually issued by a government or company, which normally pays a fixed rate of interest over a given time period, at the end of which the initial amount borrowed is repaid.

Floating rate notes (FRNs): Securities whose interest (income) payments are periodically adjusted depending on the change in a reference interest rate.

Gilts: Fixed income securities issued by the UK government.

Government bonds: Fixed income securities issued by governments, that normally pay a fixed rate of interest over a given time period, at the end of which the initial investment is repaid.

Hard currency (bonds): Refers to bonds denominated in a highly traded, relatively stable international currency, rather than in the bond issuer's local currency. Bonds issued in a more stable hard currency, such as the US dollar, can be more attractive to investors where there are concerns that the local currency could lose value over time, eroding the value of bonds and their income.

Hedging: A method of reducing unnecessary or unintended risk.

High yield bonds: Fixed income securities issued by companies with a low credit rating from a recognised credit rating agency. They are considered to be at higher risk of default than better quality, ie higher-rated fixed income securities but have the potential for higher rewards. Default means that a company or government is unable to meet interest payments or repay the initial investment amount at the end of security's life.

Index: An index represents a particular market or a portion of it, serving as a performance indicator for that market.

Index-linked bonds: Fixed income securities where both the value of the loan and the interest payments are adjusted in line with inflation over the life of the security. Also referred to as inflation-linked bonds.

Inflation: The rate of increase in the cost of living. Inflation is usually quoted as an annual percentage, comparing the average price this month with the same month a year earlier.

Investment Association (IA): The UK trade body that represents fund managers. It works with investment managers, liaising with government on matters of taxation and regulation, and also aims to help investors understand the industry and the investment options available to them.

Investment grade bonds: Fixed income securities issued by a company with a medium or high credit rating from a recognised credit rating agency. They are considered to be at lower risk from default than those issued by companies with lower credit ratings. Default means that a company or government is unable to meet interest payments or repay the initial investment amount at the end of a security's life.

Issuer: An entity that sells securities, such as fixed income securities and company shares.

Leverage: When referring to a company, leverage is the level of a company's debt in relation to its assets. A company with significantly more debt than capital is considered to be leveraged. It can also refer to a fund that borrows money or uses derivatives to magnify an investment position.

Liquidity: A company is considered highly liquid if it has plenty of cash at its disposal. A company's shares are considered highly liquid if they can be easily bought or sold since large amounts are regularly traded.

Local currency (bonds): Refers to bonds denominated in the currency of the issuer's country, rather than in a highly traded international currency, such as the US dollar. The value of local currency bonds tends to fluctuate more than bonds issued in a hard currency, as these currencies tend to be less stable.

Long position: Refers to ownership of a security held in the expectation that the security will rise in value.

Macroeconomic: Refers to the performance and behaviour of an economy at the regional or national level. Macroeconomic factors such as economic output, unemployment, inflation and investment are key indicators of economic performance. Sometimes abbreviated to 'macro'.

Maturity: The length of time until the initial investment amount of a fixed income security is due to be repaid to the holder of the security.

Modified duration: A measure of the sensitivity of a fixed income security, called a bond, or bond fund to changes in interest rates. The longer a bond or bond fund's duration, the more sensitive it is to interest rate movements.

Monetary policy: A central bank's regulation of money in circulation and interest rates.

Morningstar™: A provider of independent investment research, including performance statistics and independent fund ratings.

Near cash: Deposits or investments with similar characteristics to cash.

Net: The proportion of a fund invested in, for example, different sectors. Derivatives are included. The latter are financial instruments whose value, and price, are dependent on one or more underlying assets.

Net Asset Value (NAV): A fund's net asset value is calculated by taking the current value of the fund's assets and subtracting its liabilities.

Open-Ended Investment Company (OEIC): A type of managed fund, whose value is directly linked to the value of the fund's underlying investments.

Options: Financial contracts that offer the right, but not the obligation, to buy or sell an asset at a given price on or before a given date in the future.

Overweight: If a fund is 'overweight' a stock, it holds a larger proportion of that stock than the comparable index or sector.

Payment date: The date on which distributions will be paid by the fund to investors, usually the last business day of the month.

Physical: The fund's exposure excluding derivatives, which are financial instruments whose value, and price, is dependent on one or more underlying securities.

Property Expense Ratio (PER): Property expenses are the operating expenses that relate to the management of the property assets in the portfolio. These include: insurance and rates, rent review and lease renewal costs and maintenance and repairs, but not improvements. They depend on the level of activity taking place within the fund. The Property Expense Ratio is the ratio of property expenses to the fund's net asset value.

Retail Prices Index (RPI): A UK inflation index that measures the rate of change of prices for a basket of goods and services in the UK, including mortgage payments and council tax.

Securitise/Securitisation: The creation and issuance of tradable securities, such as bonds, that are backed by the income generated by an illiquid asset or group of assets. By pooling a collection of illiquid assets, such as mortgages, securities backed by the mortgages' income payments can be packaged and sold to a wider range of investors.

Share class: Each M&G fund has different share classes, such as A, I and R. Each has a different level of charges and minimum investment. Details on charges and minimum investments can be found in the Key Investor Information Documents.

Short position: A way for a fund manager to express his or her view that the market might fall in value.

Short-dated corporate bonds: Fixed income securities issued by companies and repaid over relatively short periods.

Short-dated government bonds: Fixed income securities issued by governments and repaid over relatively short periods.

Swap: A swap is a derivative contract where two parties agree to exchange separate streams of cashflows. A common type of swap is an interest rate swap to hedge against interest rate risk.

Synthetic inflation-linked bonds: Refers to securities created using a combination of assets to simulate the characteristics of inflation-linked bonds. By buying inflation-linked government bonds and selling protection against companies defaulting on their debts, using credit default swaps, the combined synthetic investment will behave similarly to a physical inflation-linked bond, had one had been issued. Synthetic inflation-linked bonds are usually created where a company does not have any inflation-linked bonds in issue.

Total return: The term for the gain or loss derived from an investment over a particular period. Total return includes income (in the form of interest or dividend payments) and capital gains.

Unit trust: A type of managed fund, whose value is directly linked to the value of the fund's underlying investments.

Valuation: The worth of an asset or company based on its current price.

Volatility: The degree to which a given security, fund, or index rapidly changes. It is calculated as the degree of deviation from the norm for that type of investment over a given time period. The higher the volatility, the riskier the security tends to be.

Yield: This refers to either the interest received from a fixed income security or to the dividends received from a share. It is usually expressed as a percentage based on the investment's costs, its current market value or its face value. Dividends represent a share in the profits of a company and are paid out to the company's shareholders at set times of the year.
